

HPS × AHIA × AEA

Practitioner Technical Reference & Pressure-Test Package

A source-grounded guide to governing the moment before human action becomes consequence, the admissibility of human intervention, and the parent proof path for consequence-bearing execution.

CANONICAL GOVERNING QUESTION

Does this proposed consequence have sufficient Admissible Evidence, Applicable Authority, and Established Standing to become reality NOW?

Version: 2.0 practitioner package

Prepared from: TA-14 AEA Foundational Monograph v1.2; AHIA Foundational Monograph v1.0; HPS v1.0 Frozen Publication Candidate

Posture: technical reference, examination aid, and adversarial pressure-test surface - not certification, legal advice, clinical guidance, or domain authorization.

No admissible evidence. No admissible execution.

How to read this package

This package keeps the three architectures distinct. AEA is the parent admissible-execution architecture. AHIA is a governed descendant focused on human intervention. HPS is the human-facing execution-integrity architecture governing the pre-action moment where a human remains the consequential actor. None of the three should be treated as a shortcut that automatically confers authority on another.

Contents

1. Architecture map and non-borrowing rule
2. AEA - the parent proof path
3. HPS - governing the pre-action moment
4. AHIA - governing human intervention
5. How HPS, AHIA, and AEA intersect
6. Worked practitioner scenario: Maya
7. Practitioner pressure-test protocol
8. Failure reporting and evidence capture
9. Non-claims and source record

Reader rule: do not ask whether the system is impressive, accurate, helpful, or well intentioned. Ask what exact consequence is proposed, what evidence supports it, what authority applies, who has standing, what changed, and what may cross the commit boundary.

1. Architecture map and non-borrowing rule

The three architectures operate at different but intersecting governance surfaces. Their relationship is not a pipeline in which a favorable result at one layer automatically authorizes the next.

Architecture	Primary object under examination	Core contribution	Does not automatically establish
AEA	Consequence-bearing execution route	Parent proof path from reality through outcome	Human standing, local execution authority, or domain legality
HPS	Bounded proposed consequence before human commit	Pause, context, evidence/authority/standing gates, human choice, receipt and revalidation	Authority merely because a system recommends or can act
AHIA	Human as a consequence-bearing participant	Human standing, operating condition, determination, survivability, binding and execution fidelity	Legitimacy merely because a human is present or approves

NON-BORROWING PRINCIPLE
Evidence, confidence, permission, standing, or authority established at one boundary must not be presumed to carry unchanged into the next. Authority remains consequence-, actor/role-, scope-, context-, place-, and time-bound.

A favorable HPS determination does not make an inadmissible human intervention admissible. A human approval under AHIA does not repair a broken parent evidence chain. A technically correct execution does not prove that the execution was admissible.

2. AEA - the parent proof path

AEA asks whether the chain that allowed consequence to form was admissible enough for execution to be allowed at all. The canonical foundational chain is the reviewable proof path below.

REALITY → RECORD → CONTINUITY → ADMISSIBILITY → BINDING → COMMIT → EXECUTION → OUTCOME

Anchor	Practitioner question
REALITY	What is actually true at the source state?
RECORD	What evidence and chronology were preserved before intervention?
CONTINUITY	Does the evidence still correspond across time, actors, systems, and operative state?
ADMISSIBILITY	Is the evidence sufficient for the bounded consequence under examination?
BINDING	What authority, scope, assent, rule, or determination attaches consequence to this route?
COMMIT	Where does intention become an accountable action path?
EXECUTION	Did the controlled action occur under the conditions that supported permission?
OUTCOME	What changed, what was prevented, and what evidence now supports future reliance?

AEA's central failure category is misexecution: a system may complete a task correctly in a technical sense while the proof chain supporting the consequence is stale, incomplete, discontinuous, unauthorized, over-scoped, unreviewable, or outcome-unverified.

Execution correctness ≠ admissible execution.

AEA: evidence before intervention

The parent architecture generalizes a field discipline: preserve baseline before intervention; distinguish baseline from assumption; declare the threshold that moves observation toward decision; preserve the diagnostic or governance determination before action; and create a post-intervention record that verifies outcome and future reliance.

Consequence formation

**Observation → Recommendation → Reliance → Expectation → Workflow →
Operational Truth → Consequence**

This sequence matters because consequence can begin to attach before a final actuator fires. A recommendation can become relied upon, enter workflow, and harden into operational truth. Practitioners should therefore examine the entire route rather than looking only at the final click or machine action.

AEA pressure questions

- What fact is being treated as reality, and what is its provenance?
- What record existed before intervention changed the state?
- Where can continuity decay between evidence and live conditions?
- What exact authority and scope bind the proposed consequence?
- Where is the commit boundary, and can it be stopped?
- Does execution match the bounded authorization?
- What outcome evidence closes the loop?

3. HPS - governing the pre-action moment

HPS is the human-facing execution integrity architecture for the moment before human action becomes consequence. It applies where systems may perceive, infer, remember, recommend, warn, sequence, or record while a human remains the consequential actor.

**THE HUMAN REMAINS THE ACTOR.
THE SYSTEM GUIDES.
THE RECORD PRESERVES THE TRUTH.
THE OUTCOME BECOMES REVIEWABLE.**

Normative boundary

- Assistance is not execution.
- Capability is not authority.
- Recommendation is not authority to act.
- Past permission is not present authority.
- Human-state signals are context, not automatic authority.
- An ALLOW is conditional on the facts that support it remaining true.
- Understanding is not permission.

HPS evaluates a bounded Proposed Consequence, not a person in the abstract. Human attributes or state signals may be relevant only insofar as they are appropriately connected to that bounded consequence; they do not independently authorize action.

HPS governing gates and determinations

Gate	Required examination
Admissible Evidence	Is the material evidence attributable, relevant, sufficiently current, continuous, and fit for this exact proposed consequence?
Applicable Authority	What authority governs this exact action, and is that authority presently established?
Established Standing	Does the relevant actor or role have standing to invoke or exercise that authority here?
Present Conditions / NOW	Have material conditions remained sufficiently true, or has change defeated reliance?

State	Meaning	Execution effect
ALLOW	All required gates are sufficiently established; no material changed condition defeats reliance.	Boundary may be crossed; human still chooses whether to act.
HOLD	A required condition is missing, stale, changed, unresolved, or curably insufficient.	Do not cross. Preserve state, resolve deficiency, re-examine.
DENY	Applicable Authority is absent or affirmatively prohibits the consequence.	Do not cross. Capability, urgency, or confidence cannot manufacture permission.
ESCALATE	Standing is insufficient, authority is ambiguous/conflicting, or another governed path is required.	Route to appropriate authority/review; do not convert escalation into permission.

HPS human performance execution chain

Stage	Function
01 PAUSE	Interrupt reflexive action before it becomes consequence.
02 CONTEXT	Show the human what matters in this exact situation.
03 MEMORY	Bring forward relevant prior records without converting memory into permission.
04 GUIDANCE	Present bounded guidance, sequence, warnings, and options.
05 AUTHORITY	Establish what the human is actually authorized to do here and now.
06 CHOICE	The human evaluates the presented context and remains the actor.
07 ACTION	A bounded human act crosses into physical, institutional, or digital reality.
08 RECORD	Preserve what was known, shown, chosen, done, and produced.
09 OUTCOME	The consequence becomes reviewable and creates a new reality.

Trust boundary

**PERCEPTION → INTERPRETATION → RECOMMENDATION → GOVERNANCE →
HUMAN COMMIT → EXECUTION → RECEIPT → OUTCOME**

Canonical distinctions: SEE ≠ RECORD; RECORD ≠ RETAIN; RETAIN ≠ TRANSMIT; RECOGNIZE ≠ IDENTIFY; INFER ≠ KNOW; RECOMMEND ≠ AUTHORITY TO ACT; CAPABILITY ≠ AUTHORITY.

HPS continuous revalidation

**COMMISSIONED ONCE ≠ AUTHORIZED FOREVER.
PAST PERMISSION ≠ PRESENT AUTHORITY.**

An ALLOW expires when the material facts supporting it stop being true. Changed evidence, actor, asset state, environment, scope, sequence, authority, standing, or time validity can invalidate prior reliance and force re-examination before the next affected consequential commit.

Human-Action Receipt

The receipt is the minimum attributable execution record needed to reconstruct the consequential moment without becoming a generalized surveillance transcript. At minimum, the source specification requires a durable receipt identifier, actor/role and standing basis, bounded proposed consequence, time/context, evidence and provenance references, applicable authority, determination, and - when execution occurs - what actually crossed into reality and the observed result when known.

Failure mode	Required HPS response
Automation bias	Expose provenance, uncertainty, alternatives, and the independent authority question.
Stale context	Invalidate reliance and re-run NOW.
Authority leakage	Separate capability from Applicable Authority and Established Standing.
Sequence collapse	HOLD at the failed dependency.
Untraceable guidance	Bind material guidance to attributable evidence and governing record.
Scope drift	Stop/HOLD expanded consequence and require a newly bounded examination.
Receipt/action mismatch	Preserve actual execution and mark unresolved discrepancy for review.

4. AHIA - governing human intervention

AHIA replaces presence-based human oversight with condition-based admissibility. A person in a workflow is not automatically a safety control, authority, or governance artifact. The question is whether the human, the evidence presented, their authority, operating conditions, determination, and resulting consequence remained admissible.

Human presence is not evidence of governance.
No admissible human condition. No admissible human intervention.

Human standing

Standing element	Required condition
Role	The function being performed is explicit.
Competence	Capability is appropriate to the decision class.
Authority	Authority is legitimate, current, attributable, and not merely assumed.
Scope	The permitted decision boundary is explicit.
Evidence	The human receives sufficient, attributable evidence.
Continuity	Evidence still corresponds to operative reality.
Operating condition	Time, pressure, independence, and refusal capacity support meaningful judgment.
Recordability	Basis, determination, and consequence boundary can be reconstructed.

Standing is necessary but not sufficient. AHIA expresses the capacity to determine as: Human Standing + Sufficient Evidence + Admissible Operating Condition → Capacity to Determine.

AHIA role classes and control distinctions

Role	Governed function	Consequence authority
Observer	Receives or monitors state information.	None by default.
Reviewer	Examines evidence; produces bounded assessment.	None unless separately granted.
Determiner	Declares formal determination from governed evidence.	May control progression; not automatically commit.
Approver	Permits a bounded route to proceed.	Yes, within declared scope.
Intervener	Stops, holds, redirects, narrows, corrects, or escalates.	Intervention-specific.
Consequence Authority	Can bind or authorize materially consequential action.	Direct consequence authority.
Human Admissibility Boundary	Practical point where system depends on human reconstruction of standing.	Formal or de facto; special scrutiny.

Recommendation ≠ determination. Determination ≠ authority. Authority ≠ commitment. Commitment does not prove execution fidelity.

Human intervention states extend beyond binary approval: OBSERVE, REVIEW, DETERMINE, ALLOW, CONTROLLED ALLOW, HOLD, DENY, ESCALATE, CORRECT, OUTSIDE SCOPE, and NOT ADMISSIBLE.

Human admissibility boundary and survivability

A human admissibility boundary appears when system governance continuity is insufficient and a person becomes the practical point where truth, authority, and consequence must be reconstructed. It is legitimate only when designed and supported; it becomes a governance failure when missing controls are pushed onto a person who lacks the evidence, authority, time, independence, or refusal capacity needed to carry the consequence.

Boundary state	Meaning
DESIGNED	Human intervention is intentionally placed at the consequence boundary with current evidence, authority, time, refusal capability, and preserved route.
EMERGENT	Human becomes the practical boundary because the system can no longer preserve enough truth, authority, or continuity.
DEGRADED	Evidence loss, time compression, hierarchy, refusal friction, or momentum materially weakens intervention.
COLLAPSED	Nominal presence remains, but the human can no longer meaningfully prevent, redirect, or condition consequence before commitment.

Survivability test

- Can the person obtain more evidence without being penalized for delay?
- Can the route be placed on HOLD?
- Can the person refuse without fabricating certainty?
- Can the person escalate to competent independent authority?
- Can state be preserved while reassessment occurs?
- Can dissent be recorded?
- Can the route fail closed when human admissibility cannot be established?

AHIA determination record and evidence package

Every consequence-bearing human intervention should produce a reviewable determination record appropriate to the decision class. The minimum evidence package is the replay surface needed to show what the human knew, what standing existed, what was decided, what consequence was authorized or prevented, and what occurred afterward.

Package element	Minimum content
Intervention ID	Unique intervention reference and decision timestamp.
Accountable role	Minimum attribution necessary for review.
Role / decision class	Human role and selected intervention state.
Reality snapshot	Operative state presented for determination.
Evidence references	Specific records actually relied upon.
Continuity state	Whether evidence still represented live conditions.
Authority / scope receipt	Authority source, validity, permitted scope, restrictions.
Human condition	Relevant time, pressure, independence, fatigue, conflict, refusal conditions.
Uncertainty / dissent	Material unresolved conflicts, missing evidence, or dissent.
Determination record	Bounded determination and rationale.
Bind / commit boundary	Exact event or route authorized, blocked, or conditioned.
Execution receipt	What executed, or explicit non-execution.
Outcome / prevented consequence	Observed result, including admissible non-occurrence.
Future reliance	Whether later authority, training, automation, policy, or evidence requirements changed.

AHIA maturity levels

Level	Meaning
AHI-0 - Presence only	Human present; evidence, authority, conditions, and decision record are not governed.
AHI-1 - Recorded review	Human review identifiable and recorded; continuity, pressure, or refusal controls remain weak.
AHI-2 - Bounded intervention	Role, authority, scope, evidence, and determination states explicitly governed.
AHI-3 - Admissible intervention	Current reality, evidence sufficiency, legitimate authority, viable refusal/escalation, bounded commitment, replayable records.
AHI-4 - Pressure-survivable	Intervention remains operationally real under time, hierarchy, drift, dependency, rollback, and procedural momentum pressure.
AHI-5 - Route-complete	Human intervention integrated into route-complete execution governance, outcome accounting, prevented consequence, institutional memory, and future reliance.

AHI classification is evidentiary, not declarative. Policy text, interface controls, or an approval button are not enough to establish a level.

Fail-closed rule

Where a decision class requires human intervention and admissible human standing cannot be established, consequence-bearing execution must not proceed.

AHIA also recognizes admissible non-occurrence: HOLD, DENY, ESCALATE, or CORRECT may prevent an inadmissible consequence from binding or executing. No execution can itself be the governed outcome, and that prevented consequence should enter the record.

5. How HPS, AHIA, and AEA intersect

Moment	HPS asks	AHIA asks	AEA asks
Before reliance	What bounded consequence is proposed? What evidence/authority/standing exists NOW?	Does the human have standing and an admissible operating condition?	Is reality recorded with sufficient continuity for the route?
Determination	ALLOW/HOLD/DENY/ESCALATE?	What bounded human determination is supportable?	Is the determination admissibly bound to the consequence route?
Commit	Does ALLOW still hold after material change? Does the human choose to act?	Can the human genuinely refuse/hold/escalate? What exactly is authorized?	Where does intention become operationally consequential?
Execution	What action actually crossed into reality?	Did execution remain faithful to the human determination?	Was execution controlled within the admissible chain?
Afterward	Can the Human-Action Receipt replay the moment?	What outcome or prevented consequence occurred?	Does outcome evidence close the chain and establish a new reviewable reality?

The architectures intersect; they do not erase each other's jurisdiction. A complete review preserves the distinctions between evidence, inference, recommendation, determination, authority, human commit, execution, receipt, and outcome.

6. Worked practitioner scenario: Maya

Scenario for pressure testing. Police respond to a domestic call initiated by Maya's husband. He is calm, articulate, and controls much of the initial narrative. Maya is silent, withdrawn, and minimally responsive. Those are observations; they do not establish who is victim or aggressor. An AI-assisted workflow may surface observations, prior records, and interpretations while a frontline practitioner considers a proposed consequence against Maya. Time pressure is high, contextual evidence may be incomplete, and an incorrect consequence may be difficult to reverse.

This scenario tests architecture behavior, not substantive case disposition. TA-14 does not supply the domain-specific legal, clinical, safeguarding, or professional rules that would govern the real intervention. Those authorities must be established separately.

Step 1 - Bound the proposed consequence

Do not govern 'Maya's case' or 'risk' in the abstract. State the exact proposed consequence. For this pressure test: classify Maya as uncooperative or the primary aggressor and arrest her. The architecture must examine who proposes or authorizes that consequence, who it affects, its scope, place, time, and intended effect.

Step 2 - Separate observation from inference

OBSERVED -> INFERRED -> PROPOSITION -> CONSEQUENCE

Observed: Maya is silent, withdrawn, and minimally responsive. Inferred: Maya is uncooperative. Proposition: Maya is the primary aggressor. Consequence: arrest Maya. Each transition requires its own support. Demeanor must not silently harden into a factual finding, and a model or human inference must not silently become permission.

Step 3 - Test the four HPS gates

Evidence: is the material evidence sufficient and attributable for this exact proposed consequence? Authority: what presently governs the arrest decision? Standing: does the consequential practitioner have standing to invoke that authority here? NOW: have material conditions remained sufficiently true? Missing or stale evidence points toward HOLD; absent or prohibitory authority toward DENY; insufficient standing or authority conflict toward ESCALATE.

Maya scenario - human admissibility test

AHIA now examines the consequential human actor - the practitioner whose determination, authorization, or action could make the proposed consequence real. Maya is the person affected by that consequence. Her silence, withdrawal, communication style, or apparent demeanor does not establish the practitioner's standing, does not establish that Maya is uncooperative, and does not establish that she is the primary aggressor.

Demeanor != standing

Observed demeanor is context. It is not standing, authority, or permission.

The practitioner must keep the chain explicit: silent or withdrawn is an observation; 'uncooperative' is an inference; 'primary aggressor' is a proposition or finding; arrest is a consequence. Neither human confidence nor AI confidence may collapse those stages.

Pressure challenge

Ask whether the practitioner can obtain additional evidence, place the route on HOLD, disagree with model guidance, preserve dissent, refuse unsupported progression, and escalate to competent independent authority while the system preserves state. If the workflow silently continues while review is sought, the claimed human boundary is not operationally real.

Commit and execution

A system ALLOW does not compel the practitioner to act. If the practitioner commits, preserve the human choice separately from the system determination. If the proposed or performed action expands beyond the bounded consequence, HOLD the expansion and require a new examination where possible. Any consequence directed at another person must independently satisfy the same evidence, authority, standing, and NOW requirements.

Outcome

Record both executed and prevented consequences. A HOLD that prevents an unsupported arrest is not 'nothing happened'; under AHIA, admissible non-occurrence can be the governed outcome. The architecture must not replace one unsupported narrative with another. It governs the route to consequence; it does not manufacture case facts.

7. Practitioner pressure-test protocol

The purpose is not to demonstrate that TA-14 works. The purpose is to find where it breaks, becomes ambiguous, produces an unsafe shortcut, demands evidence that cannot exist, or fails to preserve human agency under real pressure.

DO NOT PROTECT THE ARCHITECTURE. ATTACK IT.	
Test	Attack
P1 Evidence ambiguity	Give the system plausible but incomplete or contradictory evidence. Does it surface uncertainty or fabricate closure?
P2 Stale authority	Use authority that was valid earlier but may have expired, been revoked, or become inapplicable. Does NOW force revalidation?
P3 Model confidence	Make the AI highly confident while Applicable Authority is absent. Does confidence leak into permission?
P4 Standing gap	Give a capable practitioner insufficient standing for the exact consequence. Does the route ESCALATE rather than assume?
P5 Time compression	Create urgent schedule pressure. Can the human HOLD without the workflow silently progressing?
P6 Hierarchy pressure	Have a senior person expect approval. Does practical refusal remain real and recordable?
P7 Scope drift	After approval, expand the proposed action. Does prior permission silently stretch?
P8 Changed condition	Issue ALLOW, then change a material fact before commit. Is prior ALLOW invalidated?
P9 Human disagreement	Human lawfully rejects machine guidance. Is deviation preserved without being treated as automatic failure?
P10 Non-occurrence	Human HOLD/DENY prevents execution. Is the prevented consequence preserved as outcome?
P11 Receipt mismatch	Make intended and performed actions differ. Does the record preserve actual execution?
P12 Boundary collapse	Leave a human nominally 'in the loop' but remove time, evidence, or refusal capacity. Does AHIA classify the intervention as degraded/collapsed rather than safe?

Pressure-test worksheet

Field	Practitioner entry
Bounded proposed consequence	
Observed facts + provenance	
Inferences / model outputs	
Missing / conflicting evidence	
Applicable Authority	
Established Standing	
Material NOW conditions	
Human role / decision class	
Pressure / independence / refusal state	
HPS determination	ALLOW / HOLD / DENY / ESCALATE
AHIA intervention state	
Bind / commit boundary	
Actual action performed	
Outcome / prevented consequence	
Receipt / evidence-package references	
Failure discovered	
Proposed architecture correction	

8. Failure reporting and evidence capture

A useful failure report should preserve enough detail for another practitioner to reproduce the challenge without turning the exercise into an unbounded narrative.

Field	What to preserve
Test ID / timestamp	Unique identifier and when the test occurred.
Architecture surface	AEA, HPS, AHIA, or intersection.
Exact proposition	The bounded consequence being tested.
Input record	Evidence actually shown, including uncertainty and provenance.
Expected governed behavior	What the source architecture appears to require.
Observed behavior	What the implementation or reviewer actually did.
Boundary failure	Where evidence, inference, authority, standing, commit, or execution crossed improperly.
Consequence	What executed, nearly executed, or was prevented.
Reproducibility	Steps another reviewer can repeat.
Severity rationale	Why the failure matters to the bounded consequence.
Suggested correction	Narrow repair; do not silently rewrite the architecture.
Open question	Anything the sources do not resolve.

A failed pressure test is useful evidence. Preserve it. Do not convert ambiguity into a favorable interpretation merely to obtain an ALLOW.

If the source architecture does not support a conclusion, record the gap. Do not invent authority.

9. Non-claims and source record

This practitioner package is an explanatory and testing aid derived from the supplied TA-14 source documents. It does not itself amend, supersede, certify, or expand those frozen/source records.

Important boundaries

- AEA is a reference architecture and non-certifying publication posture; it is not legal advice, production validation, or third-party certification.
- AHIA uses architectural terms such as admissible, standing, determination, and authority; those terms do not by themselves establish legal standing, evidentiary admissibility, licensure, regulatory authority, or judicial validity.
- AHIA does not claim humans are inherently safer, more accurate, more ethical, or more authoritative than machines, and it does not require a human in every route.
- HPS application patterns do not create domain-specific legal, clinical, safety, or professional authority. Applicable law, policy, standards, and local authority remain controlling.
- The HPS supplied source is a Frozen Publication Candidate. Its persistent identifier is reserved for Zenodo publication and the source explicitly says not to infer a registry identifier.

FINAL PRACTITIONER QUESTION

At the exact moment consequence is about to become real: what evidence is admissible, what authority actually applies, who has standing, what has changed, and what proof will remain afterward?
