TA14 AUTHORITY GOVERNANCE INSTITUTION

# CUBE × TA-14

## THE NEXT TRUST LAYER FOR INTELLIGENT BUILDINGS

A strategic exploration of how connected BMS workflows and independent execution governance could complement one another.

CUBE connects the work. TA-14 could independently examine whether a proposed consequential action has sufficient evidence, applicable authority, and established standing to execute NOW.

**Prepared for Hector Hernandez | CEO, CUBE USA**

Discussion edition v3.0 • 3 November 2026

Independent discussion material. No partnership, endorsement, integration, or commercial commitment is represented.

# Why this conversation matters

CUBE and TA-14 address adjacent, but fundamentally different, parts of the intelligent-building problem.

## THE OPPORTUNITY

CUBE publicly describes a connected environment for BMS contractors: common job records, commissioning workflows, service operations and AI-assisted access to operational data. TA-14 focuses on a separate boundary: when a finding or recommendation becomes a proposed physical consequence, who or what has authority to authorize it?

### A complementary thesis

CUBE could remain the system of operational work. TA-14 could be evaluated as an independent, auditable decision boundary for selected consequential actions.

## WHAT SUCCESS WOULD LOOK LIKE

A contractor continues working inside familiar CUBE workflows. When an action crosses an agreed consequence threshold, the proposed action is examined against evidence, authority, standing and current context. The resulting determination is documented and returned to the workflow.

## WHAT WE ARE NOT CLAIMING

This is not an assertion that CUBE currently authorizes autonomous live commands, or that TA-14 is already integrated with CUBE. Actual integration capabilities and operational constraints require direct technical verification.

# Two strengths. One possible boundary.

### CUBE | SYSTEM OF WORK

Job record • Commissioning • Service • AI-assisted workflows

↓

### TA-14 | INDEPENDENT GOVERNANCE

Admissible evidence • Applicable authority • Established standing

↓

### BOUNDED RESULT | AUDITABLE RECEIPT

ALLOW • HOLD • DENY • ESCALATE • Revalidation at commit

## THE CRITICAL DISTINCTION

A detected deficiency is not a diagnosis. A diagnosis is not an authorization. A technically possible command is not automatically an admissible execution.

# What CUBE already brings

Based on Hector Hernandez and CUBE Solution Hub public statements shared for this discussion; not independently product-tested.

## COMMON OPERATIONAL CONTEXT

A shared job record spanning applications, reducing duplicate entry and fragmented records.

## COMMISSIONING WORKBENCH

Controller-versus-field comparisons, tolerances, deficiencies and sequence-related checks.

## SERVICE AND CUSTOMER VISIBILITY

Work orders, sites, assets, technician activity, recommendations and owner-facing service information.

## AI AND CONNECTIVITY

Permission-scoped work-order queries and public examples of MCP-based connected workflows.

### Verification needed

Confirm actual API and MCP endpoints, record export, identity and permission models, event hooks, read/write privileges, and any control-system command pathways.

# Governance at the consequence boundary

## ADMISSIBLE EVIDENCE

Preserve source, time, context, provenance, continuity and admissibility of records supporting a proposed consequence.

## APPLICABLE AUTHORITY

Identify the authority governing the specific proposed action; technical capability alone does not grant permission.

## ESTABLISHED STANDING

Establish the actor, declared capacity, standing basis and relationship to applicable authority.

## COMMIT-TIME REVALIDATION

Recheck evidence, authority, standing and context at the point of binding and commit. Commissioned once does not mean authorized forever.

## EXPLICIT DETERMINATIONS

ALLOW, HOLD, DENY and ESCALATE, each accompanied by a bounded rationale and a durable decision record.

### TA-14 governing question

Does this proposed consequence have sufficient Admissible Evidence, Applicable Authority, and Established Standing to become reality NOW?

# One commissioning deficiency, examined

## 01 OBSERVE

Controller commands outdoor-air damper to 20%; physical inspection observes closed damper.

## 02 RECORD

Preserve command, actual feedback, field evidence, timestamps, identity and calibration context.

## 03 INTERPRET

Mismatch establishes a deficiency, not by itself a root cause or permission to change a sequence.

## 04 PROPOSE

Define a specific corrective action and its bounded physical consequence.

## 05 GOVERN

Check evidence admissibility, applicable authority, standing and current conditions.

## 06 COMMIT / VERIFY

Only an ALLOW permits the bounded action; preserve post-action measurements and outcome.

# Four possible outcomes

### HOLD | INSUFFICIENT EVIDENCE

A field observation lacks reliable time, identity or continuity. Obtain missing evidence before acting.

### DENY | NO APPLICABLE PERMISSION

The evidence may be sufficient, but the actor lacks authority to make the live change.

### ESCALATE | MATERIAL AMBIGUITY

Ownership, delegated authority or risk is disputed; refer to a named authorized reviewer.

### ALLOW | BOUNDED EXECUTION

Evidence, authority, standing and present context support the specific action. Revalidate at commit and capture the outcome.

# Where CUBE could benefit

## PRODUCT DIFFERENTIATION

Potentially distinguish connected workflows from independently governed consequential workflows.

## SERVICE ACCOUNTABILITY

Link findings, approvals, interventions and outcomes to defensible decision records.

## OWNER ASSURANCE

Show building owners what changed, why it was justified, and who had standing to authorize it.

## AI-READY SAFEGUARDS

Keep the line clear between AI information, proposed action and actual permission to execute.

## OPTIONAL PLATFORM EXTENSION

Explore an integration that adds governance to existing CUBE workflows rather than replacing them.

### Commercial hypothesis, not a forecast

These are potential customer and product benefits. No incremental revenue, conversion rate, savings or adoption has been measured or promised.

# What TA-14 could gain

## REAL-WORLD VALIDATION

Exposure to practical commissioning and service workflows, constraints and contractor expectations.

## TECHNICAL INTEGRATION SURFACE

A potential pathway to test governance receipts alongside a shared job and asset record.

## ENGINEERING FEEDBACK

Input from experienced BMS practitioners on evidence, delegated permissions and operational friction.

## REPEATABLE DEMONSTRATION

A carefully scoped reference use case, if both parties agree to evaluation and publication terms.

## POTENTIAL COMMERCIAL PATH

Only after results justify it: optional module, licensing, co-development or a documented case study.

### Maintain institutional independence

TA-14 governance determinations and the TA14 Authority Governance Institution must retain clear independence from commercial execution and vendor claims.

# Start small. Measure the result.

## PHASE A | ARCHITECTURE REVIEW

Select one CUBE workflow. Map evidence sources, actors, permissions, decisions and the exact consequence boundary.

## PHASE B | READ-ONLY DEMONSTRATION

Use synthetic or explicitly consented records. Produce TA-14 decision receipts without changing equipment.

## PHASE C | SHADOW-MODE EVALUATION

Compare determinations with existing human review. Measure completeness, false holds, latency and usability.

## PHASE D | BOUNDED OPERATIONAL PILOT

Consider only after written safety, security, responsibility, authorization, rollback and acceptance criteria are established.

### Suggested acceptance measures

Evidence completeness • traceable actor and authority • correct fail-closed outcomes • low workflow friction • understandable receipts • no unintended writes.

# What the relationship could become

## NEAR TERM | COMMISSIONING

Governed deficiency closure, inspection evidence and sign-off conditions.

## NEXT | SERVICE

Evidence-bound approvals for consequential service recommendations and interventions.

## LATER | AI COPILOTS

Clear separation of an AI answer, a recommended action and a permitted execution.

## LONG TERM | BUILDING CONTROLS

Selective, bounded, revalidated authorization for high-consequence commands, only where integration and safety permit.

### Possible structures

Independent evaluation → technical pilot → optional integration or licensing → jointly approved case study. Every stage requires mutual agreement; no stage is presumed.

# Five questions for Hector

## 01 QUESTION

Which CUBE workflow currently has the greatest gap between detecting a problem and authorizing its correction?

## 02 QUESTION

Can commissioning data expose source, timestamp, field-observer identity and controller readings through an API?

## 03 QUESTION

How are owner, contractor, technician and service-manager approval rights defined and enforced?

## 04 QUESTION

Which MCP or API functions are read-only, and which can modify records or operational state?

## 05 QUESTION

Would CUBE engineering evaluate one synthetic deficiency and a read-only governance receipt?

### Best first-meeting outcome

Agree on one candidate workflow, one technical contact and one bounded next step. No partnership commitment is needed to begin a responsible examination.

# An invitation to explore

The immediate proposal is not to announce a partnership. It is to determine whether an independent execution-governance boundary adds measurable value to a CUBE workflow without compromising the product experience, operational safety or institutional independence.

### A practical first step

A 30- to 45-minute architecture discussion, followed - only if useful - by a read-only synthetic demonstration scoped jointly with CUBE engineering.

## GOVERNING PRINCIPLE

No admissible evidence. No admissible execution.

## STATUS AND SOURCES

CUBE descriptions reflect the Hector Hernandez LinkedIn profile and CUBE Solution Hub posts shared 3 November 2026 concerning commissioning, service, shared job records, AI queries and MCP integrations. CUBE product claims are vendor-described and require verification. TA-14 concepts reflect the TA14 Authority Governance Institution architecture. This is an independent discussion brief, not a joint publication.
